

# Chapter 1

Let the prime factorization of an integer  $n$  be written as follows:

$$n = \prod_{p \text{ prime}} p_i^{x_i},$$

where  $p_i$  is the  $i^{\text{th}}$  prime and  $x_i \geq 0$ .

For problems 1 through 6, lowercase latin letters  $a, b, \dots, y, z$  represent integers.

- 1.) *Claim:* If  $(a, b) = 1$ , and  $c \mid a$  and  $d \mid b$ , then  $(c, d) = 1$ .

*Proof:* Since  $(a, b) = 1$ , there exist  $x$  and  $y$  where  $ax + by = 1$ . We also know that  $c \mid a$  and  $d \mid b$ , so there exists  $m$  and  $n$  where  $a = cm$  and  $b = dn$ , thus  $ax + by = c(mx) + d(ny) = 1$ , thus  $(c, d) = 1$ . ■

- 2.) *Claim:* If  $(a, b) = (a, c) = 1$ , then  $(a, bc) = 1$ .

*Proof:* Since  $(a, b) = (a, c) = 1$ , there exist  $x_1, x_2, y_1$ , and  $y_2$  where  $ax_1 + by_1 = 1$  and  $ax_2 + cy_2 = 1$ . We can see that

$$\begin{aligned} 1 &= (ax_1 + by_1)(ax_2 + cy_2) = (a^2x_1x_2 + abx_2y_1 + acx_1y_2 + bcy_1y_2) \\ &= a(ax_1x_2 + bx_2y_1 + cx_1y_2) + bc(y_1y_2), \end{aligned}$$

so  $(a, bc) = 1$ . ■

- 3.) *Claim:* If  $(a, b) = 1$ , then  $(a^n, b^k) = 1$  for all  $n$  and  $k$ .

*Proof:* We can take the prime factorizations of  $a$  and  $b$ :

$$a = \prod p_i^{x_i} \quad \text{and} \quad b = \prod p_i^{y_i},$$

where  $p_i$  are the primes, and  $x_i$  and  $y_i$  are integers that depend on  $p_i$ . Further, the prime factorizations for  $a^n$  and  $b^k$  are

$$a^n = \left( \prod p_i^{x_i} \right)^n = \prod p_i^{x_i^n}$$

and

$$b^k = \left( \prod p_i^{y_i} \right)^k = \prod p_i^{y_i^k}$$

Since  $(a, b) = 1$ , we know that  $\min \{x_i, y_i\} = 0$  for all  $i$ , thus  $\min \{x_i^n, y_i^k\} = 0$ , thus  $(a^n, b^k) = 1$ . ■

- 4.) *Claim:* If  $(a, b) = 1$ , then  $(a + b, a - b)$  is either 1 or 2.

*Proof:* Let  $d = (a + b, a - b)$ , then  $d \mid a + b$  and  $d \mid a - b$ , so  $a + b = dm$  and  $a - b = dn$  for some  $m$  and  $n$ . We have  $a + b = a - b + 2b = dn + 2b$ , so  $d \mid dn + 2b$ , and thus  $d \mid 2b$ . Suppose  $b$  is even, then  $a$  is odd, since  $(a, b) = 1$ , thus  $a + b$  is odd, thus  $d$  divides an odd number. But  $b$  is even, so  $2b$  is even, thus  $d$  divides an even number too, thus  $d = 1$ . Finally, suppose  $b$  is odd. If  $a$  is even we are done as before, but if  $a$  is odd \*\*\*

5.) \*\*\*

6.) *Claim:* If  $(a, b) = 1$  and  $d \mid a + b$ , then  $(a, d) = (b, d) = 1$ .

*Proof:* Since  $(a, b) = 1$ , we know that  $ax + by = 1$  for some  $x$  and  $y$ , and since  $d \mid a + b$ ,  $a + b = dm$  for some  $m$ . We have  $a + b = dm \implies b = dm - a$ , thus  $ax + by = ax + (dm - a)y = ax + dmy - ay = a(x - y) + d(my) = 1$ , thus  $(a, d) = 1$ . A similar argument shows that  $(b, d) = 1$  as well. ■

7.) \*\*\*

8.) *Claim:* Every integer can be represented as  $a^2b$ , where  $a$  and  $b$  are unique positive integers and  $b$  is squarefree.

*Proof:* We obtain the unique prime factorization of  $n$  as follows:

$$n = \prod_{\text{primes}} p_i^{x_i} \prod_{\text{primes}} p_j^{x_j},$$

where powers  $x_i$  of  $p_i$  are all odd, and powers  $x_j$  of  $p_j$  are all even. From this we can see that

$$n = p_i \prod_{\text{primes}} p_i^{x_i-1} \prod_{\text{primes}} p_j^{x_j}$$
